

Client Requirement Document

Project Overview

The client operates a combined legal and public service assistance business that handles advocacy work along with document and filing services such as ITR filing, PAN card applications, ration card applications, and similar government or compliance-related jobs. This type of business needs a centralized system because one office often manages multiple service categories, multiple payment modes, and multiple internal follow-up stages at the same time.[cite:10] [cite:11] [cite:14]

The main business problem is not only billing but also operational control. Client payments may be received in cash, UPI, bank transfer, or partial combinations, while official portal fees and related charges may be paid separately by the office, creating a gap unless every job is tracked through one connected ledger and workflow.[cite:7] [cite:10] [cite:15]

Business Problem Statement

The current challenge is that transactions and service records are spread across informal methods such as memory, notebooks, payment apps, and separate office handling. This creates difficulty in tracking customer payments, office-paid portal fees, pending balances, invoice records, and staff accountability for each client job.[cite:3] [cite:10] [cite:14]

The client therefore requires a centralized digital platform that connects customer intake, service execution, payment collection, expense logging, receipts, invoices, and reporting. Practice-management and billing platforms already show that centralized workflows improve control over billing records, task status, and financial visibility.[cite:3] [cite:5] [cite:11]

Proposed Solution

The required solution is a centralized service and transaction management platform designed for an advocate office and document service center. It should function as a hybrid system combining client management, service workflow, receipt and invoice generation, payment tracking, expense recording, and management reporting in one place.[cite:3] [cite:10] [cite:11]

The core structure of the platform should be based on a job-wise or file-wise workflow. Every customer request should create one digital job record containing client details, service type, assigned staff member, documents submitted, professional fees, portal fees, amounts received, expenses paid, pending balance, and final delivery status.[cite:10] [cite:11] [cite:14]

Solution Goals

- Create one central record for every customer job, linked to all financial and workflow activity.[cite:10][cite:11]
- Separate professional charges from government, portal, court, or third-party fees for better financial clarity.[cite:12][cite:15]
- Track both cash and online transactions with receipt-level detail.[cite:5][cite:7]
- Record office-paid expenses against the correct job or client file.[cite:10][cite:12]
- Improve staff accountability through assignment, activity tracking, and status management.[cite:11][cite:14]
- Generate management reports for daily collections, pending balances, revenue, and expenses.[cite:3][cite:10]

Functional Modules

1. Client Management Module

This module should store complete customer profiles including name, mobile number, address, identification details, repeat-service history, and linked service files. It should allow quick retrieval of past jobs so the office can handle repeat clients without rebuilding records every time.[cite:5][cite:14]

2. Service and Job Management Module

This module should create and manage one job card for each service request. It should support service categories such as legal consultation, advocacy, ITR filing, PAN card, ration card, affidavit, notarization, registrations, and any custom office service defined by the business.[cite:10][cite:11]

Each job should include status stages such as new, document pending, submitted, under process, completed, delivered, and closed. This structure reflects how legal and service-management software organizes work progression and accountability.[cite:11][cite:14]

3. Document Tracking Module

This module should record which customer documents were received, which are pending, and which final outputs were delivered. It should reduce delays caused by missing paperwork and should give staff a checklist-based workflow for every job type.[cite:11][cite:14]

4. Billing and Invoicing Module

This module should generate invoices, receipts, and payment summaries for each client job. Legal and invoicing platforms emphasize centralized invoice creation, payment history, and approval-ready records, which is relevant to this business because every service job must be financially traceable.[cite:3][cite:5][cite:6]

5. Payment Collection Module

This module should record all payment modes including cash, UPI, bank transfer, card, and split payments. It should support advance payments, partial payments, pending balances, and final settlement so that the office has a clean record of what the client has already paid and what is still due.[cite:7][cite:15]

6. Expense and Portal Fee Module

This module should log all office-side expenses linked to each job, including portal fees, government filing charges, stamp fees, courier charges, document print charges, and similar out-of-pocket expenses. This is essential because the office often pays such charges first and must recover or reconcile them correctly later.[cite:10][cite:12][cite:15]

7. Staff and Task Assignment Module

This module should assign each job to a team member and record updates, remarks, due dates, and stage changes. Case and practice systems commonly use centralized matter tracking and assignment logs, which are important here because the client already has a small team and needs visibility into who handled what.[cite:11][cite:14]

8. Reporting and Dashboard Module

This module should provide daily cash summary, online collection summary, total billing, pending amount report, service-wise revenue, expense summary, and staff-wise work reports. Centralized billing systems are valuable precisely because they convert scattered transactions into management-ready financial visibility.[cite:3][cite:7][cite:10]

Key Features Required

Feature	Requirement
Job-wise ledger	Every client file should show income, expenses, and balance in one view.[cite:10][cite:14]
Multi-payment support	Cash, UPI, bank, card, and split transactions should be supported.[cite:7][cite:15]
Service fee split	Professional charge and portal/government fee should be tracked separately.[cite:12][cite:15]
Receipt generation	Instant payment receipts should be generated for each collection.[cite:5][cite:6]
Invoice generation	Full invoices should be available for completed or billed jobs.[cite:3][cite:5]
Team tracking	Staff assignments and status updates should be attached to each job.[cite:11][cite:14]
Reports	Daily, monthly, service-wise, and pending reports should be available.[cite:3][cite:10]
Search and filters	Jobs should be searchable by name, mobile, date, service, and payment status.[cite:11][cite:14]

User Roles

Admin / Owner

The admin should have access to all records, reports, job files, staff activity, billing records, and settings. This role should control service types, fee structures, user permissions, invoice formats, and overall financial visibility.[cite:3] [cite:10] [cite:11]

Manager / Senior Staff

This role should monitor daily operations, assign work, verify status progress, review collections, and manage pending jobs. It should also support supervision of staff productivity and service completion timelines.[cite:11] [cite:14]

Executive / Operator

This role should create client records, open jobs, upload or mark documents, record customer payments, and update service status. Access may be limited so that operators can work on assigned files without changing high-level financial settings.[cite:11] [cite:14]

Accountant / Billing Staff

This role should verify receipts, issue invoices, match collections, reconcile expenses, and review day-end summaries. Because the business handles both direct client collections and office-paid charges, this role is important for keeping clean financial records.[cite:3] [cite:7] [cite:10]

Recommended Workflow

1. Create client profile at first visit and select the service type needed.[cite:11] [cite:14]
2. Open a job card and record required documents, service charges, and expected portal or government fees.[cite:10] [cite:12]
3. Assign the job to a staff member and move it into the appropriate processing stage.[cite:11] [cite:14]
4. Record any advance amount received from the client, including payment mode.[cite:7] [cite:15]
5. Log any office-paid portal or official fees directly against the same job card.[cite:10] [cite:12]
6. Update status until submission, approval, or final completion.[cite:11] [cite:14]
7. Generate receipt or invoice, collect remaining balance, and close the job with delivery confirmation.[cite:3] [cite:5] [cite:6]

Website Content Structure

The website should present the solution as a professional business management platform for advocates, document centers, and legal-compliance offices. The messaging should focus on one central promise: better control over client files, payments, expenses, invoices, and team workflow in one system.[cite:10] [cite:11] [cite:14]

Home Page

Hero section:

- **Headline:** Centralized management for legal, filing, and document service businesses.
- **Subheadline:** Manage client jobs, cash and online payments, portal fees, invoices, receipts, and staff workflow from one platform.
- **Primary CTA:** Request Demo.
- **Secondary CTA:** View Features.

Key problem section:

- Cash and online collections are hard to reconcile.
- Portal and government fees are paid separately.
- Staff-managed files are difficult to track.
- Invoice and receipt records are often scattered.

Solution section:

- One job card for every client request.
- One ledger for income, expense, and balance.
- One dashboard for staff, billing, and reports.

Why this platform section:

- Built for advocate offices and service centers.
- Supports both legal work and public-service documentation jobs.
- Gives financial clarity with workflow control.

About Page

- Introduce the business problem in the legal and document-assistance market.
- Explain that many offices handle mixed services, multiple payment modes, and manual follow-up.
- Position the platform as a practical digital system for office discipline, reporting, and customer trust.[cite:10] [cite:11] [cite:14]

Services / Modules Page

This page should explain the main modules in a service-card format:

- Client management.
- Job and case tracking.
- Payment collection.
- Expense and portal fee tracking.
- Invoice and receipt management.
- Staff assignment.
- Dashboard and reports.[cite:3] [cite:10] [cite:11]

Industries / Use Cases Page

Suggested use cases:

- Advocate offices.
- Tax and ITR filing centers.
- PAN and government document service centers.
- CA support desks.
- Multi-service legal and compliance offices.[cite:10] [cite:11] [cite:14]

Features Page

Suggested feature sections:

- Job-wise financial tracking.
- Cash and online transaction records.
- Advance and balance management.
- Portal fee recovery visibility.
- Team-wise job assignment.
- Daily collection reports.
- Customer history and repeat-service records.[cite:3] [cite:7] [cite:10]

Workflow Page

Suggested explanation blocks:

- Register client.
- Create service job.
- Assign staff.
- Collect payment.

- Pay portal fee if needed.
- Update status.
- Generate receipt/invoice.
- Close and deliver file.[cite:3] [cite:10] [cite:11]

Contact / Demo Page

Suggested content:

- Book a demo.
- Discuss office workflow requirements.
- Request custom setup based on service types.
- Get a solution for legal, taxation, and document-management operations.

Suggested Website Messaging

Main Tagline Options

- One platform for legal work, filings, payments, and office control.
- Manage every client file, fee, and workflow from one dashboard.
- Built for advocate offices and document service centers.

Supporting Copy

- Track every client service from intake to delivery.
- Record cash, UPI, and bank payments with proper receipts.
- Manage portal fees and office expenses without confusion.
- Assign work to staff and monitor status in real time.
- Generate invoices, receipts, and collection reports from one system.

Recommended Deliverables

- Responsive business website explaining the platform and its modules.
- Admin dashboard design for internal software users.
- Role-based workflow structure for owner, manager, operator, and billing staff.
- Reporting dashboard for collections, expenses, pending balances, and staff activity.
[cite:3] [cite:10] [cite:11]

Next Scope Definition

The next project phase should define software screens and business rules in more detail. That should include field-level forms, status definitions, invoice format, report filters, service categories, permission settings, and the exact dashboard structure needed for daily operations.[cite:3][cite:10][cite:14]
